CITY TRAFFIC MANAGEMENT DIVISION: 2026 CONGESTION & MITIGATION REPORT

=====

Published: March 2026

Author: Department of Urban Mobility

1. EXECUTIVE SUMMARY

This report analyzes peak-hour traffic patterns across major city arterial corridors. The primary objective is to evaluate the impact of rapid commercial development on vehicle throughput, average delay times, and commuter safety.

2. CORRIDOR ANALYSIS: METRO AVENUE

Metro Avenue experiences severe bottlenecking between 08:00 AM – 10:00 AM (Morning Peak) and 05:00 PM – 07:00 PM (Evening Peak).

Key Findings:

- * The intersection at Metro Ave and 5th Street currently operates at Level of Service (LOS) E.
- * Average vehicle delay at this junction has increased by 22% over the last 14 months, primarily due to the new commercial shopping plaza on the northwest quadrant.
- * Queue lengths during evening peak hours frequently spill back into the upstream intersection (3rd Street), causing gridlock.

3. PROPOSED INTELLIGENT SOLUTIONS

To mitigate the gridlock, the Traffic Engineering team recommends deploying an AI-driven Adaptive Traffic Signal Control (ATSC) system. This system utilizes real-time camera feeds to dynamically adjust green light cycles based on queue lengths rather than fixed timers. Initial simulations project a 15% reduction in overall corridor delay.
